

# DSG ENERGY Audits / Retrofit Projects

Our energy audits take a lot of the work out of bidding lighting retrofit projects. Best of all, this service is of no cost to you. With our energy audits, we can help you find ways to satisfy the most common lighting project demands:

## Here's How Energy Audits Work At DSG

### ON-SITE VISIT & EVALUATION

First, we meet you (and oftentimes your customer) at the job site to survey the area, take an inventory of fixtures, discuss lighting objectives and answer any questions.

### LIGHTING ASSESSMENT

Next, we identify which fixtures would be best based on the objectives we uncover during the on-site visit. Using the latest software, we create a photometric layout that provides you with the locations of the fixtures and light levels, along with lighting level comparisons.

### ENERGY ASSESSMENT

We'll provide easy-to-read documents that show energy usage comparisons, the total cost to implement the new layout, the total wattage used, maintenance cost comparisons and the timeframe of the payback on the project. Plus, we'll identify and factor in any potential rebates from your utility provider.

### LIGHTING CONTROL

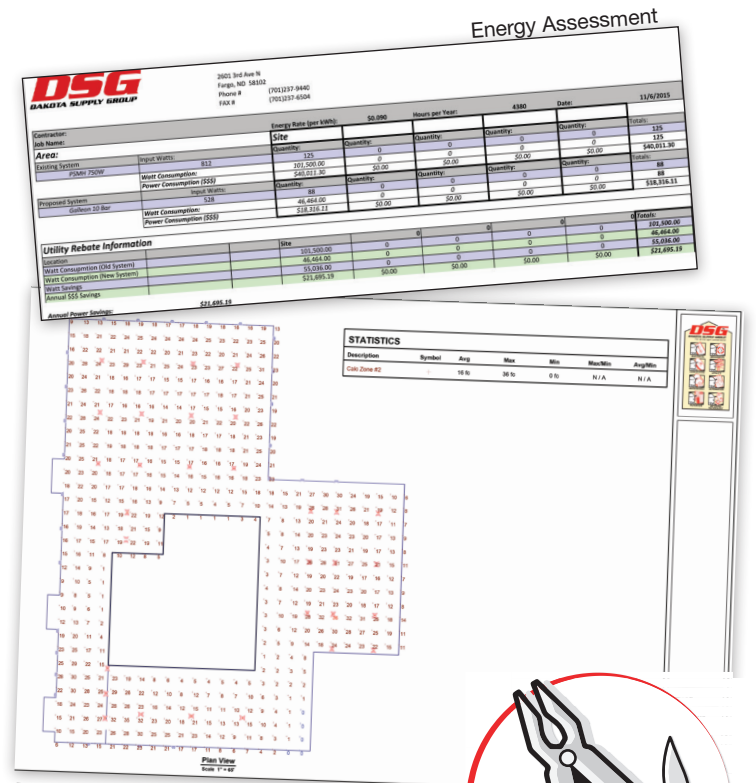

Our expertise in lighting control can help you to increase energy savings for your customers by incorporating any combination of daylight harvesting, occupancy sensors, dimmers and controls.

### FINAL PRESENTATION & DOCUMENTS

Incorporating your costs and markups, we provide you with a professional-looking presentation (which includes cut sheets of all proposed products) via email that you can share with your own customer. Depending on the scope of the project, you can expect this within a week after the on-site visit.

### REVISIONS

Our energy audits are a collaborative effort, and we're happy to revise the energy audit as much as you need until it's just right.

Exterior Lighting Assessment

Let DSG turn your next lighting retrofit project into a success story that your customers will share.
